The fitting of the bhi NEDSP1061-KBD module may involve the removal of small surface mount components and the drilling out of the transceivers’ case. This should only be carried out by a qualified engineer. bhi accepts no responsibility for the fitting or installation of the NEDSP1061-KBD module and are not liable for any damage to equipment caused by its fitment. Fitting this module may invalidate your warranty.

All attempts have been made to ensure that this information is up to date. It is possible that these instructions contain errors, or the equipment is slightly different to the one used to compile this information. In all cases it is up to the installer to ensure that the module is fitted correctly.

By installing this module you are doing so at your own risk.

NEIM1031 MKII In-line module.
The NEIM1031 MKII provides a flexible solution to noise reduction and easily fits between your equipment and speaker.

Features:
- Fully adaptive noise cancellation 9 -35dB
- 8 user selectable noise cancellation levels
- Mono earpiece socket
- Input sensitivity control
- Noise cancellation On/Off switch
- Line level in/out
- Input overload indication
- Power on/off with audio bypass.

NEIM1031 accessories.

LSPKR
20 Watt 4 ohm extension speaker for use with the NEIM1031. Fitted with a 3.5mm mono jack plug.

1031-STAND
Perspex mounting stand for the NEIM1031. Allows the NEIM1031 to be mounted for a more comfortable operating position.

1030-UKPA UK DC power adapter
1030-EUPA European DC power adapter

Amplified DSP modules.
Easy to install retrofit for existing equipment and extension speakers or older tranceivers.

NEDSP1062-PCB: Basic amplified DSP module.
NEDSP1062 - KBD: Amplified DSP module controlled by a 2 button keyboard.
Appendix D
Other bhi products

Other noise cancellation products from bhi. Visit www.bhi-ltd.com for more information.

6.1 NES10-2 MK3 Noise Eliminating speaker.
Amplified DSP noise cancellation speaker with new rotary filter select knob and increased audio power.

Features:
• Fully adaptive noise cancellation 9 -35dB
• 8 user selectable noise cancellation levels
• Mono earpiece socket
• Input sensitivity control
• Noise cancellation On/Off switch
• LED indication of power and noise cancellation
• 12-24VDC operation
• On/Off audio bypass switch.
• Easy to install with adjustable mounting bracket
• 2m audio lead
• Optional extras available.

6.2 DSPKR Superb 10 Watt rms audio DSP noise cancelling speaker

Features:
• 7 DSP filter levels 9 - 24dB
• 12-18V DC operation
• Simple control of all functions
• sleep mode - Filter store function
• Volume control - Input level indicator
• Comes with 2m audio lead, Fused DC power lead & manual

1042 switch box.
Allows up to 6 pieces of equipment to be connected to one speaker or inline module. 3 inputs loaded at 8 ohms.

Packing List:

Please check the contents of the box.

• Operating manual
• NEDSP1061-KBD assembly
• ‘Z’ bracket
• Self adhesive mounting pads
• bhi NEDSP keyboard label

To install this module you will need the following additional items:
• service manual/circuit diagram of the equipment in which the module is to be installed.
• all the appropriate tools to disassembling the equipment
• suitable soldering iron and bits for working with surface mount devices.

Before attempting to fit this module study this manual thoroughly along with the service manual and circuit diagram for your equipment. Be careful not to move the wires on the module too much as this could lead to damage.

The keyboard is retained using the supplied ‘Z’ bracket, held in place by the loudspeaker clamp. Fix the dsp module to the inside of the lid using the self adhesive tape supplied. Carefully replace the lid ensuring that none of the wires are trapped.

Affix the bhi DSP label to the lid, over the keyboard and LED.
Drill the keyboard holes in the case lid as shown in the following diagram. Ensure the holes are de-burred.

1. Introduction.

The NEDSP1061-KBD is a modular solution to noise reduction. It incorporates DSP technology to provide up to 35dB of noise cancellation. The module is controlled by a single pushbutton with LED indication for ease of use.

1.1 NEDSP1061-KBD module features:

- Fully adaptive to changing noise environments
- Input and output level controls
- Input overload indication
- Virtually no distortion to speech signal
- Up to 35dB of noise cancellation
- 4 or 8 levels of noise reduction selectable on power up
- 5 – 15V supply range
- 4.6dB on board gain
- Single key operation of all functions
- LED indication of DSP level and status
- Small size 26mm x 37mm

1.2 Limitations.

This module is designed to pass speech. Other signals such as data and music will to some degree pass through, but the integrity of these signals cannot be guaranteed.

This module is designed to be placed in a low level audio path only. The module will not drive a loudspeaker or other high power load (see bhi NEDSP1062 amplified DSP module).

The unit is single channel (mono).

Cut the white wire closest to the front of the transceiver. Connect the NEDSP1061-KBD screened lead as follows:
- Red wire to connector J1431
- Blue wire to remaining end of the cut lead.
- Screen - cut off.

Insulate both the connections with the supplied rubber sleeves.

The red power lead for the NEDSP1061-KBD is connected to the PCB. Carefully remove the solder mask from the PCB surface in the position shown in figure 4. (it may be necessary to lengthen the lead).

Remove solder mask here

Connect Red +Ve lead from the NEDSP1061 here

Appendix C Icom 706 MKII G
1.3 Audio DSP Noise cancellation.

The bhi DSP processes the incoming audio signal and then differentiates the speech from the noise. The unwanted noise and interference is then attenuated to leave only the speech.

The following diagrams are taken from actual audio signals and illustrate how the audio signal is being processed.

Original signal.
Speech with a lot of background noise

Processed speech.
Speech with reduced noise

Reduced noise

This module is designed for communication type applications. The upper frequency limit is 4.5KHz and therefore not suitable for hi fidelity applications.
2. Module description.

2.1 Module Layout.

The following diagram shows the layout of the NEDSP1061-KBD module.

![Module Layout Diagram](image)

2.2 Module Connections.

The NEDSP1061-KBD module has five connections.

- **Red wire**: 5 - 15VDC
- **M3 Tag**: 0V
- **Screened Lead**:
  - Red: Audio In (to module)
  - Blue: Audio Out (from module)
  - Black: Audio Screen

14. Solder the screen from the DSP board to the ground on CN10 and insulate with tape.
15. Refit CN10 plug into CN10 socket.
16. Replace the speaker and speaker mounting bracket making sure no wires are getting pinched.
17. Place two thicknesses of double sided tape to the front right corner of the speaker bracket and mount switch PCB (see figure 5).
18. Connect radio to power and aerial and test DSP board works OK readjust beep, input and output levels if required. (Details in section 4 page 14)
19. Drill the top cover as detailed below.
20. Place the cover on the radio and check alignment of the switch and adjust if necessary.
21. Replace the top cover screws and fit the bhi label.

Table 1. NEDSP1061-KBD Electrical characteristics

2.4 Controls.

Controls are provided to allow the NEDSP1061-KBD to be integrated into the target system. 3 level controls are provided.

2.4.1 Input Level:
To set the audio level to the optimum level for the DSP.

2.4.2 Output Level:
To match the output level of the DSP module to that of the following stage.

2.4.3 Beep volume level:
Allows the user to adjust the beep volume control to suit. The beep volume can be reduced to zero if required.

The modules are factory set to the maximum level.

Turning the potentiometers anti clock wise will increase the levels.
Note: The potentiometers do not have end stops. It is possible to set the potentiometer in a dead band between the ends, resulting in the audio being lost, continue rotating and the audio will return.

2.4.4 Overload LED.
The overload LED circuit monitors the amplitude of the audio level entering the DSP module. The LED will illuminate when the amplitude exceeds the maximum permitted level. If the amplitude is increased further the DSP will clamp the audio signal to prevent damage to the DSP input. This will cause the audio signal to become distorted. The optimum level is achieved when the loudest peaks of the input audio, just cause the LED to glow.

2.5 Module mounting.
The DSP module has four mounting holes that can be used to retain the unit inside the equipment. Alternatively a self adhesive pad is supplied to allow the module to be mounted in a convenient position - without the need for drilling.

Two holes need to be drilled in the casing of the equipment for the keyboard. Hole sizes and positions can be found in section 7 - page 19.

The keyboard can retained using the supplied ‘Z’ bracket or alternatively retained using a suitable adhesive, or the mounting pads supplied.
In some equipment it may be possible to clamp the bracket under the loudspeaker bracket (e.g. FT-817) Cover the keyboard holes with the supplied self adhesive label.

7. Carefully scrape the solder mask off the track to expose the copper.
8. Solder the red lead of the DSP board to this point.
9. Remove the plug from CN10 and clip the white wire that is next to the ground in the middle.
Appendix B
Kenwood TS50

Have the front of radio facing you and refer to the photographs in this manual to assist with the board installation.

1. Remove the top cover from the radio.
2. Remove speaker and speaker mount.
3. Fix double sided tape to the bottom of the DSP board (DSP chip side) making sure the tape lines up with the edges of the board.
4. Fit the DSP board as shown in figure 1.

5. Remove the mounting screw for the fan and attach the ground lug at this point.
6. Locate the pc board trace coming from pin 8 of the audio amp chip (IC7) This track is between C127 elect cap and C126 elect surface mount cap. There is a + printed on top of this track for C126 (see figure 1).

Figure 1. Location of C126, C127, CN10 and DSP module

3. Installation

3.1 Introduction.
Before commencing installation study the equipment's service manual/circuit diagram thoroughly to familiarise yourself with the circuit diagram and disassembly procedure. Detailed information for fitment into specific equipment is available in the appendices of this manual.

Audio source
Pre amp
NEDSP1061
Power amp
Audio out

Figure 3. Basic connection diagram

Audio source
Pre amp
NEDSP1061
Power amp
Audio out

Figure 4. NEDSP1061-KBD Audio path
For optimum performance provide the module with a constant amplitude signal, for example before the volume control.

Note:
On some modern receivers/transceivers the volume control is digital and doesn’t operate in the audio path. Contact the manufacturer for advise for the most suitable position for the DSP module.

3.3 Fitting.
After locating a suitable location for the module in the circuit, refer to the service manual for disassembly information.

3.3.1 Audio connections.
Carefully remove the chosen coupling capacitor, taking care to not damage the PCB pads. Solder the blue wire from the screened lead to the power amp side of the capacitor and the red to the other. The black wire should be connected to a convenient 0V
3.3.2 Power connections.

5 - 15VDC (9V typically) is required to operate the module. The lower the voltage, the less heat the module will have to dissipate.

Locate a convenient point to connect the power. Ensure that this point is connected after the power switch, otherwise the DSP module will be drawing power all the time, and may discharge the batteries (where fitted). Connect the red wire to this point.

The 0V connection is formed using the M3 ring tag. Locate a suitable 0V point (such as a PCB retaining screw that is fixed into the chassis).

When routing the wires, ensure they are away from strong sources of RF or high voltage.

---

**Figure 3. Fitted module**
The levels come factory set to the maximum position. This should be adequate for most applications. However the module can be adjusted as follows.

Tune the equipment to a strong signal.
Switch off the noise reduction (LED should illuminate orange or red).

Adjust the input P2 until the overload led illuminates. Back off the potentiometer approximately a 1/4 of a turn.

Adjust P1 to give the correct listening volume, without distortion.

Adjust P3 to give the desired beep volume level, or off if required.

Replace the main unit PCB. The NEDSP1061-KBD screened lead fits in the cut out provided for the front antenna connector.

Replace the main unit, connections, and all screws except the front right hand screw.

Drill the holes for the lid, as per the drawing on page 25 of this manual.

The keyboard is mounted using the supplied ‘Z’ bracket. See page 25 for more information on installing the bracket. Alternatively use hot melt, epoxy or any suitable adhesive affix the small keyboard to the inside of the lid. Taking care to not get adhesive on the upper surface of the lid, switch or LED. Allow this to cure before continuing.

The NEDSP1061-KBD can be affixed in two positions. The preferred position is in the location of the optional filter. This provides the more mechanically secure location. If the optional filter is (or is going to be) installed the module can be installed on the inside of the lid (see photo).

Solder the red (power) lead to the drain of Q1082 (TP1084).

Connect M3 ring tag (0V leads) using the right front screw. Affix the NEDSP1061-KBD module using the supplied self adhesive pad in the chosen location.

Figure 2. NEDSP1061-KBD connection detail
6. Operation

6.1 Introduction.
All functions of the NEDSP1061-KBD are controlled by a single button.
- Single press turns the noise cancellation on/off.
- Holding down the button changes the DSP filter level.

The mode of operation is indicated both visually and audibly.

The LED is illuminated red for 4 level mode, or orange for 8 level mode when the noise cancellation is off, and not illuminated when the noise cancellation is on in 8 level mode to save on battery life. The LED is green when the filter is on in 4 level mode.

When the noise cancellation level is changed the LED will flash green to indicate which level has been selected, and simultaneously the DSP will beep to give audible indication of DSP level. This allows the operator to change the DSP level without having to look at the LED to see which level has been selected.

A short beep is emitted to acknowledge a button press. The module will store the current DSP level, and will return to this level when the equipment is switched on, but always in the off position.

6.2 Operation.
Switch on the equipment.
The LED will illuminate red or orange to indicate that the noise cancellation is off. The unit will flash/beep to indicate the DSP filter level last used.

To place the module into the audio path it is necessary to remove the audio signal coupling capacitor C1338.

The following diagram shows the position of the component.

Carefully remove the capacitor.
Connect the screened lead from the NEDSP1061-KBD module as follows:
- Red lead - to R1482 side of C1338 (audio in)
- Blue lead to the other side of C1338 (audio out)
- Screen to the grounded connection close to the capacitor.

See figure 1 below for details.

![Figure 1. Schematic detail. FT-817](image-url)
Noise cancellation on/off: Press and release the button and the LED will go off indicating that the noise cancellation is activated (green in 4 level mode). A short beep will acknowledge the key press.

Changing the filter level: Hold down the button. The LED will flash the filter level, and if the button is held it will step through all the levels (4 or 8 depending on which mode you are in), audio beeps also indicate the filter level. Release the button to select a level. This new level will be stored in memory and will be the default setting the next time the unit is powered up (always powers up with noise cancelling off).

6.3. Demonstration & Setup modes.
The NEDSP1061-KBD module features 2 preset demonstration modes, and the ability to select 4 or 8 filter levels. The demo modes show the noise cancellation abilities of the NEDSP1061-KBD module. To listen to the demonstration modes, or change the number of DSP levels it is necessary to put the module into the set up mode:

6.3.1 Demonstration 1:
Hold down the button and switch on the equipment. You will hear a 2 tone beep. Release the button now for demonstration mode 1.
The module will switch the noise cancellation on for 1.5 seconds, then off for 1.5 seconds. It will then move onto the next level and repeat this continuously through all 4 levels. This mode a particularly effective when the equipment is just receiving static, as it demonstrates the attenuation of white noise at all the levels. Alternatively tune the equipment into a good quality FM speech broadcast. This demonstration shows how little the DSP alters the speech, at any of the levels.
6.3.2 **Demonstration 2:**
Follow the procedure for 6.3.1. Wait for the second 2 tone beep, then release the key.
In this mode the filter level is set to level 3.
The noise cancellation is switched on for 3 seconds, then off for 3 seconds. This loops until the user aborts this mode.
This is a good demonstration for listening noisy SSB conversations showing the before and after.

6.3.3 **Filter Level Select:**
After the 3rd two tone beep the filter level pre-sets at level 4 in 8 level mode, release the button to select this mode. After the fourth 2 tone beep the module enters the filter level select mode. Release the button after either the 4 or 8 beeps to select the desired level mode. The module will return to normal operation after this, or hold down the button until the 2 tone beep is heard. Release the button, after a short delay the LED will flash indicating the stored level, as during the normal switch on.

6.4 **Notes about the noise reduction.**
When using the module on level 4/4 or level 8/8 some distortion may be heard. This is quite normal when listening to weak signals with high levels of noise present.

6.5 **Noise reduction levels.**
